

ZION TerraNova

A Fable of the Garden That Learned to Count

A whitepaper told as a fairy tale for grown-ups.
Every truthful fable has two layers: a story a child remembers,
and a truth an adult verifies. This document has both.

Version 5 · "Fable Edition" · v3.0.5 Mainnet Beta · July 2026

How to read this book

The fable runs in chapters. After each chapter comes a Chronicle entry — dry, verifiable facts that correspond to the story. Nothing in the chronicle is poetic license. Everything in it can be found in the code, on the chain, or in the audit records.

Whoever wants only the story, let them read the verse of the heart. Whoever wants only the numbers, let them read the chronicle. Whoever wants the whole of ZION, let them read both — because ZION is precisely that: a myth and a code that refused to part ways.

Chapter one

The town where the river flowed uphill

Once upon a time there was a town, and through that town flowed a river of money.

Rivers usually flow downhill, toward the fields and the people. But this river had been built cleverly: it flowed uphill, toward the castle. The harder the people below worked, the more water accumulated above. Those in the castle called it economics. Those below called it Thursday.

Every so often someone below would build their own well and declare: "This is a new river! This one will flow fairly!" And the people would gather and rejoice. But then it turned out that the well-builder had kept the first water for himself, sold it to his friends for a few drops, and when the well filled with the trust of the rest, they sold everything and left to build another well in the next town.

So many wells. So many promises. And the river kept flowing uphill.

Until one day a gardener sat at the edge of town and did nothing. He did not protest. He did not build a well. He just looked at the parched earth, and in that silence came the question that begins every real story:

What if water had no owner — only rules that no one could bend?

And because he was a gardener, he did not think of a bank or a revolution. He thought of a seed.

Chronicle entry — The Seed

The seed is called ZION TerraNova. It is a native Layer-1 blockchain written from scratch in Rust.

Fair launch: no ICO, no pre-sale, no founder tokens. No one got the first water — every ZION must be mined by work or received from someone who mined it.

Hard cap: 144,000,000,000 ZION. Not one more. Written in `emission.rs` as a constant, not as a

promise.

Status today: Mainnet Beta, protocol zion-v3-node/3.0.5, public launch target 31 Dec 2026.

License: MIT. Anyone may examine the seed, plant their own, or prove it is rotten.

Chapter two

Four pilgrims at the gate

But a seed is not enough. The gardener knew this — he had already seen too many seeds grow into weeds with pretty names.

And so, as happens in fables, four pilgrims came to his garden. Each carried one book and one question.

The first carried fire and the Book of Genesis. He asked: Why do you plant? — Because a seed planted in fear grows into a fence, and a seed planted in greed grows into a trap. Only a seed planted with the intent to serve life has a chance to grow into a tree under which even a stranger may sit.

The second carried wind and the Book of Quantum Revolution. She asked: Do you know why the gardens before you died? — And she showed him the formula: each of them rewarded the one who takes, and hoped that giving would come on its own. It never did. The wind does not lie: it names what is sick.

The third carried water and the Book of Ekam Deeksha. He did not ask about the garden. He asked: And you? When the garden grows and people start calling you lord gardener — what will be left of you? — Because water washes away masks. A revolution that does not transform the revolutionary only repaints the castle.

The fourth carried clay and the Book of Terra Nova. She said only: Show me your hands. — Because a vision is known by its calluses. A New Earth is not a place to flee to. It is a place that is dug, watered, lost, and planted again.

The gardener laid all four books under the seed as four roots.

And from that day a rule held in the garden: trust no one who quotes only one book. Fire without clay is a wildfire. Clay without fire is mud. Water without wind stagnates. Wind without water only stirs dust.

Chronicle entry — The Four Books

The axis of the project is formed by four real books of the ZION complex:

Book | Element | Question | What it gives

Genesis | fire | Why do we build? | intent, legitimacy

Quantum Revolution | air | What was broken? | diagnosis of extraction

Ekam Deeksha | water | Who builds? | transformation of the builder

Chapter three

The tree that pays for its own shade

The seed sprouted. And it grew differently from anything the town knew.

Every minute — precisely, like a heartbeat — the tree grew one ring. And in every ring exactly measured fruit was born. Not by the king's mood. Not by a council's vote. By a rule burned into the wood.

And now the strangest thing, the thing that started drawing people from distant towns to the garden: the tree divided itself.

From every harvest it gave nine parts out of ten to the one who guarded and watered the tree — because work should be honored, not celebrated with speeches. But a tenth it sent away, out of the garden, before anyone could touch it. Half of that tenth to the hungry. Half to children not yet born. And a single percent it burned in fire — so that no garden steward would ever grow rich just from standing at the gate.

"That's naive," the merchants laughed. "A tree that gives away will go poor."

"No," said the gardener. "A tree that gives by rule never goes poor. A tree that gives by mood goes poor — because mood can be bought."

And the tree held one more wisdom: it did not grow headlong. Every ten years it slowed by a fifth — calmly, predictably, without panic. No sudden halving of the harvest that sends guards fleeing to another tree in the night. And at the end of that long curve, after a hundred years, it keeps a perpetual small harvest — enough that it is always worth guarding.

The tree was not generous. The tree was calculated. And that is precisely why it could be trusted.

Chronicle entry — The Tree's Economy

On-chain enforcement of the split is live: the coinbase of every block has four outputs with a deterministic 89/5/5/1 ratio, and nodes reject any block with a different ratio.

Parameter | Value | Where it is written

Block time | 60 seconds | L1 consensus

Base reward | 5,400.067 ZION | BASE_REWARD

Harvest split | 89/5/5/1 % | fee_split() in emission.rs

Emission curve | Decade Decay −20 %/decade | emission.rs

Perpetual harvest | 724.784723 ZION/block from ~2126 | TAIL_REWARD

Fees | 100 % burned | deflationary mechanism

Unit | 1 ZION = 1,000,000 flowers | after fork 3.0.3

Premine | 16.78B ZION transparently | genesis block

Chapter four

The castle sends machines

The castle long ignored the tree. Then it noticed — and did what castles always do: it sent machines.

Huge, single-purpose machines that could do only one thing, but did it a million times faster than a human. In other gardens it had worked: the machines drove out the people, the guarding of trees moved into three warehouses in the world, and the "river with no owner" became a river flowing uphill again — only with a new crest.

But this tree had a strange riddle in its bark.

It did not want only speed. It wanted memory. Whoever wished to pick fruit had to pass through a maze that could not be memorized in advance — it had to be walked entirely, step by step, and each step depended on the one before. The giant machines from the castle had fast hands but a small head. The home computer of an ordinary person suddenly had almost the same chance as a machine worth millions.

"Is it forever?" people asked.

"No," the gardener answered truthfully. "Nothing is forever. But it is an intent that is measured and maintained — and when the castle builds a smarter machine, we change the maze. Only those who lie promise eternal impregnability. We promise eternal work on the walls."

Chronicle entry — The Maze

The mining algorithm is called Ekam Deeksha — Sanskrit for "one initiation". A multi-phase pipeline (Keccak-256 → SHA3-512 → matrix diffusion → memory-bound scratchpad with pseudo-random dependent reads → NPU mixing → final fusion) is designed so that memory hardness erodes the advantage of specialized ASIC chips.

ASIC-resistance is an active engineering goal (internally rated ~90 %), not dogma — parameters can be raised by soft-fork.

Ed25519 signatures, BLAKE3 hashing, LWMA difficulty (60-block window).

The network validates work, not identity, wealth, or opinion. That is the safeguard against every future tyranny of good intentions.

Chapter five

The night the snake crept into the garden

Now comes the chapter that a marketing fable would skip. That is exactly why it is here.

One summer night in 2026 a snake crept into the garden. It found a crack in the old wall — a

key lying where it should not — and began to carve into the rings fruit that had never grown. A false harvest. Money from nothing — precisely the disease the tree had come to heal.

And now pay attention, because this is where the character of the story shows.

The gardeners found the snake. And they did not do what the castle does — they did not hide it, rename it, or hire a herald to trumpet that all was well.

They did three things, in this order:

1. They said it out loud. They wrote a public record of how the snake got in, what it damaged, and whose fault it was.
2. They burned the infected wood. The whole tree, down to the root. They replaced every key, every lock, every crack in the wall.
3. They planted again. From the same seed, with the same rules — but with harder bark, in which every entry now had to prove its signature and every expenditure its origin.

The merchants in town shook their heads: They admitted a mistake! Now no one will trust them!

The exact opposite happened. Because the people of the lower town had known castles all their lives and knew one thing: an institution that never admits a mistake is mistaken all the time. A garden that burns its own tree to save the truth is the first place in this town where truth weighs more than reputation.

The new tree grows to this day. And the scar from the fire is not a disgrace — it is the ring shown to visitors first.

Chronicle entry — The Snake and the New Root

In 2026 critical vulnerabilities were found and disclosed (including missing signature verification on P2P account transactions and missing sender-balance validation allowing inflation) plus server and key compromise.

Response: public security disclosure in Ethereum Foundation format (ZION-2026-001 ... 005), consensus fix, complete key rotation, and a hard genesis reset (2026-07-06).

New	canonical	root:
-----	-----------	-------

~~4f75a0dfe6dde3b167287d445aa1ade56577b0e9166c641ed288b4c20a79bd6e~~

Since the reset: services active, E2E tests confirmed on the live network, external audit scheduled.

The lesson written into the project's culture: trust is not built by claiming error is impossible — it is built by public repair.

Chapter six

Six branches and a star

The tree grew and branched. Not randomly — like a cathedral.

The first branch, lowest and strongest, holds the truth. On it sit the guards with their tally counters, and nothing that has not passed their rules becomes reality. Without this branch everything else is just painting on air.

The second branch stretches bridges into neighboring gardens — so that fruit can travel even where other trees grow, and never forget where it came from. Bridges are beautiful and bridges are dangerous; so on each stand five guards, and the bridge opens only when all agree.

The third branch is sap and nerves — messengers between worlds and a silent watchman who never sleeps and reports when something moves in the night that should not.

The fourth branch is a playground. Yes, a playground — because the gardener knew that people learn most when they play. On this branch a great game is played about cooperation, patience, and nine tiers of consciousness. The game never judges who is a good person. It only offers a mirror.

The fifth branch is only budding and is the most important of all: it will one day carry fruit into real soil — to wells, schools, and communities that ask for help and receive it with an open ledger, not a press release.

And at the very top, above the crown, there is no branch but a star.

Its name is Issobella. It is named after love and it is terribly far away. Some say it is an observatory that will one day fly above the earth. Others say it is only a light toward which the tree straightens its trunk so it does not grow crooked.

Both are true. The star receives its share of every harvest — not because it can already spend it, but so that the garden reminds itself every minute, with every ring: we are not building for this market. We are building for the children not yet born.

Chronicle entry — The Six Layers

The Issobella fund (5 % of every block) is already filling — the horizon is not an excuse, it is an account that grows.

Layer | Name | Contents | Status

L1	Core	Rust node, pool, miner, PoW, UTXO+account	LIVE — Mainnet Beta
L2	Bridge & DeFi	wZION on 6 EVM chains, staking, farming, DAO	LIVE / BUILDING
L3	WARP & AI	cross-chain router, ZionDex, AI monitoring	BUILDING
L4	OASIS	UE5 + Rust game world, XP, 9 consciousness tiers	BUILDING
L5	Free World	humanitarian missions with on-chain impact	HORIZON (~2030)
L6	Issobella	orbital research horizon	HORIZON (2040+)

Chapter seven

The question the tree cannot yet answer

One evening a child sat down beside the gardener and asked the hardest thing:

"The tree pays those who dig. But grandma doesn't dig. Grandma carries water to the sick and teaches children to read. Why does the tree give her nothing?"

The gardener was silent for a long time. This was a question where a wrong answer destroys everything.

"Because," he said at last, slowly, "digging can be measured and cannot be faked. But care... if I decided whose care is real, I would become a castle. If a crowd voted on it, the one who can show off best would win. And if a machine measured it, people would learn to care for the machine, not for grandma's sick.

"So it can't be done?"

"It can. But slowly and backwards. First we learn to measure care for the tree itself — guarding bridges, finding snakes, fixing walls, keeping open books. That can be verified. And when, after many years, it turns out that it works and no one made a throne out of it — only then, maybe, the tree will learn to see grandma's water too.

"And if it fails?"

"Then it stays with digging. Honest digging is better than false holiness. A tree that tried to measure good and got it wrong would be worse than a castle — it would be a castle that thinks it is heaven."

The child nodded, the way children nod when they have understood more than they can say.

And above the garden, quietly, Issobella shone.

Chronicle entry — From Proof-of-Work to Proof-of-Care

Today: ZION is a Proof-of-Work network. Consensus does not validate faith, morality, meditation, or level of consciousness — and it should not. That is a security property, not a deficiency.

Horizon: Proof-of-Care (the Care Protocol) — a way to reward verifiable useful care (network monitoring, anomaly detection, contract audit, transparent humanitarian impact tracking) alongside computational work.

PoC may be activated only when seven conditions are met: cryptographic verifiability, voluntariness, privacy protection, bot-resistance, accessibility, public audit and recall, and no weakening of L1 PoW security until the model is multiply proven.

Technical seeds already exist (NPU mixing in PoW, AI monitoring, care-proof research, Sefirot Vow for validators) — and are honestly documented as work in progress, not finished.

Chapter eight

What it means to return to paradise

At the end of fables there is a moral. Here it is.

The people of the town often asked the gardener: "Do you promise us paradise?"

And he always answered: "No. Paradise cannot be promised. Paradise can only be stopped being destroyed."

Because paradise — in this fable and outside it — was never a place without work. It was a state where the world renewed itself faster than people could consume it. Where water belonged to thirst and not to a crest. Where knowledge was a well in the square and not a vault. Where a person did not have to choose between survival and conscience.

No angel with a sword drove us out of that paradise. We left on our own, step by step, every time we built another river flowing uphill.

And so we can return to it. Step by step. Block by block.

The tree of life is not a decoration in this fable. It is a manual: roots that do not lie. A trunk that cannot be bought. Sap that flows to all branches. A crown that plays. Fruit that falls even outside the fence. And a star that watches so the tree does not grow crooked.

ZION is not paradise. ZION is gardening tools.

Paradise is you, when you pick them up.

Epilogue for the skeptical (and good that you are)

This fable would not be worth the paper it is printed on if it could not be refuted. It can. Everything essential is public:

What to verify and where

Do not trust the fable. Verify the chronicle. And when the chronicle holds — then keep telling the fable, because stories that survived the calculator are the most precious thing civilization has.

What to verify | Where

Protocol | `zion-v3-node/3.0.5`
